

# De Re PlayStation®Vita

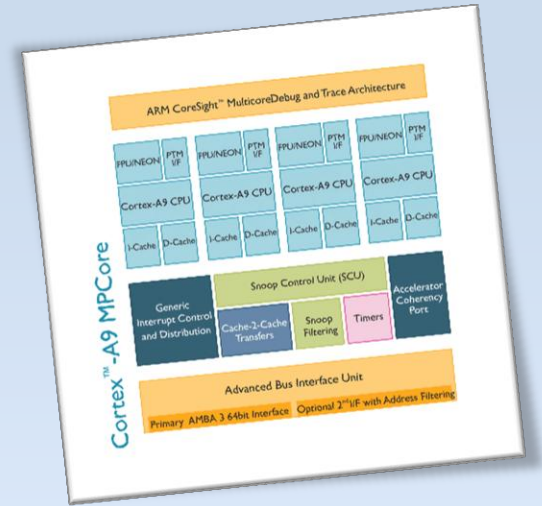

- Brief Hardware Overview
- Key Points of Differentiation
  - Hardware as well as Software
- Development Hardware
- Highlight Simplified Software Libraries & T&Ms
  - Implementation Tech Demo videos
  - Example of use in game
- Graphics on PS®Vita (Neil Brown)

# Hardware Overview

- 4x ARM® Cortex™ A9 Processor
  - High performance 32-bit processors (3 available to applications)
- POWERVR SGX543MP4+ GPU
  - Power-efficient multi-core GPU
- Dedicated HW for Media playback

# Hardware

- Standard Iconic PlayStation Buttons
- Dual Analog Sticks
- Front Touch Screen
- Rear Touch Pad
- Front & Rear Camera
- Motion Sensors

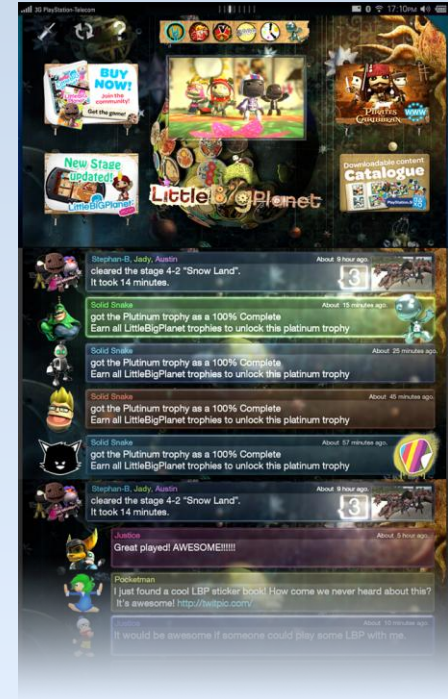

# Software

- Social Networking
  - Designed from ground up as a social networking device
- Location Based Gaming
  - Location Services
  - near
- Covered in a dedicated talk:

## [Building Community with PlayStation®Network](#)

Development

# Software

- Augmented Reality (AR)
  - Facial Recognition
  - Natural Marker
  - SLAM

# PS®Vita Development Kit

- DevKits
  - Connect via USB to PC
- TestKits
  - Both DevKits & TestKit are consumer console form factor

PSVITA

Development

# Simplified Libraries

- We've created some really simplified libraries to help you if you're a small team, or you don't need fine grained control
- Simplified video player
  - Start, stop, rewind
- Simplified audio & MIDI music playback libraries
- Simplified network interface
- The low level libraries are still available if you want to manage everything yourself
- The simplified libraries are optimised so are not slower than the low level API

# Other Libraries to Simplify Development

- Vector Maths and Geometry
- Rigid Body Physics Simulation
- Animation
- Facial Recognition
  
- Even optimised game engine:  
PhyreEngine™

# PhyreEngine™

- PlayStation optimised game engine
  - PSP, PS3, PS Vita, PC
- Provided as source
  - Portable, reusable
- Free to use, either full or in part
- Partner Programme
  - Integrating with middleware to ensure developers can choose the best solutions

Development

# Facial Recognition Tech Demo

- Video Chat tech demo By SCE Japan Studio
- Uses facial recognition libs:
  - Face Detection
  - Feature Detection
    - Eyes, Nose, Mouth, etc
  - Head tracking
  - Face attributes
    - Smile, Male/Female, Age (Adult/Child), Glasses
    - Eyes open/close (early alpha code)

# Augmented Reality (AR)

- Most games until now use a special tracking marker
- On PS Vita R&D in Natural Marker technology allows us to use almost any image as a tracking marker
- Real time **S**imultaneous **L**ocalisation **A**nd **M**apping (SLAM)
  - Use any patterned surface as a marker

# AR for gaming

- Order of priority when implementing AR:
  - Robustness (reliable)
  - Speed & Frame Rate
  - Accuracy (dependable)
- Just in case you are interested in medical AR research they come up with the following order of priority:
  - Accuracy (it needs to be dependable otherwise could have fatal consequences)
  - Speed & Frame Rate (easy to achieve as cost of hardware is not a major factor)
  - Robustness (lower as location, lighting, etc are usually predictable)

# PlayStation®Vita Inception

- Unlike our previous hardware, PS Vita was not created in isolation by our hardware engineers in Japan
- Huge amounts of input from our 1<sup>st</sup> party as well as 3<sup>rd</sup> party studios (inc T&M partners) from a very early stage
- Not just the inputs mechanisms and gameplay features you'd expect, but also
  - Hardware – SOC: CPU and GPU
  - Software – Libraries and API design and implementation
  - Tools – design and implementation
- All aspects of PS Vita has been developed from the ground up with developers in mind
- In a very real sense it has been created by developers for developers

# Useful Links

# Graphics on PlayStation®Vita

- Introduction
- Hardware
  - Tile Based Deferred Rendering
- Software
  - Programming Model

# Platform Comparison: Screen

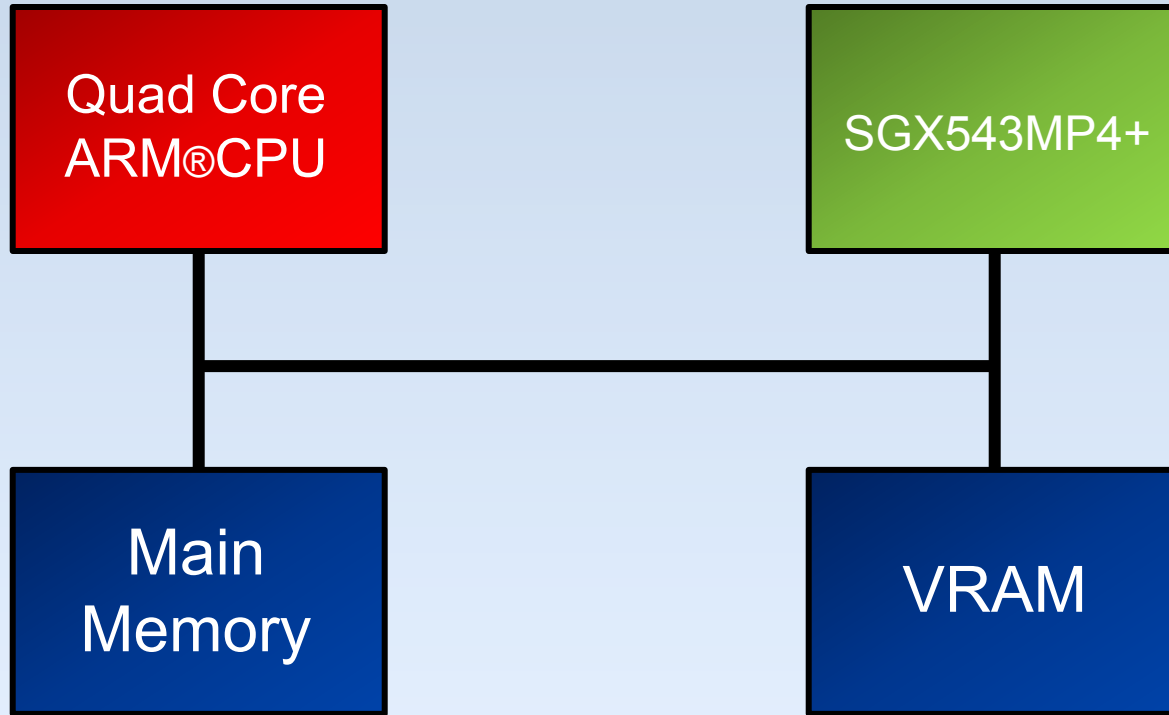

PSP™ = 480x272

PS Vita = 960x544

720p = 1280x720

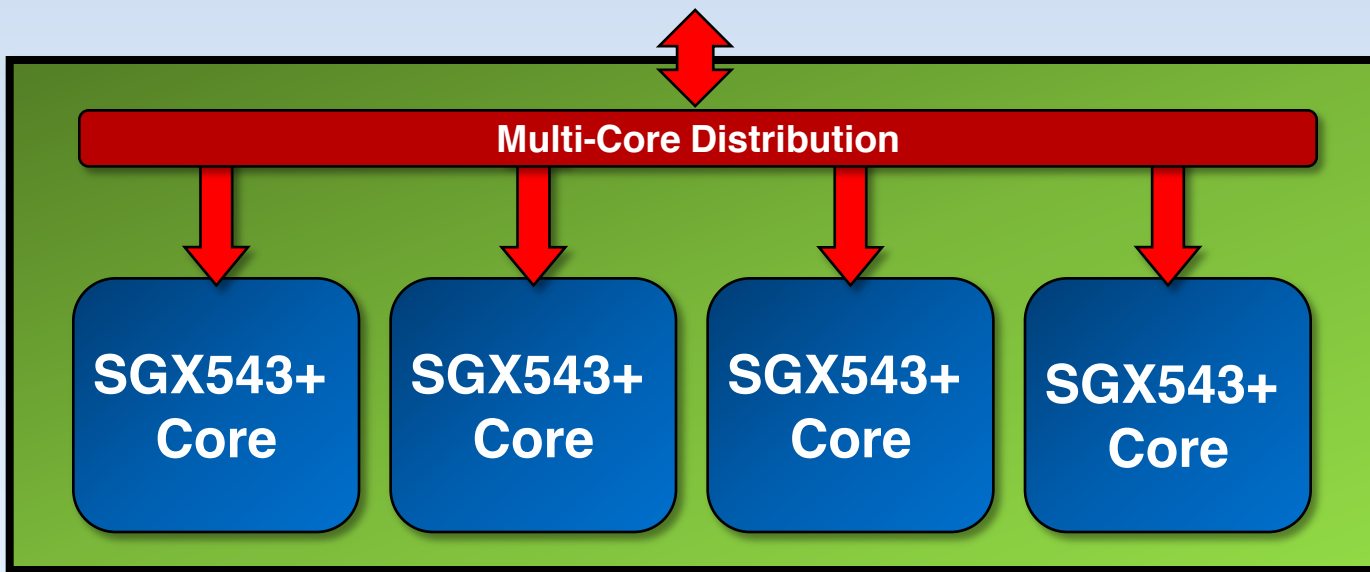

- High Resolution
- High Pixel Density
- Efficient MSAA

# PlayStation®Vita System

# POWERVR SGX543MP4+

- Power-efficient multi-core GPU
  - Automatic dynamic load balancing

# Hiding Latencies

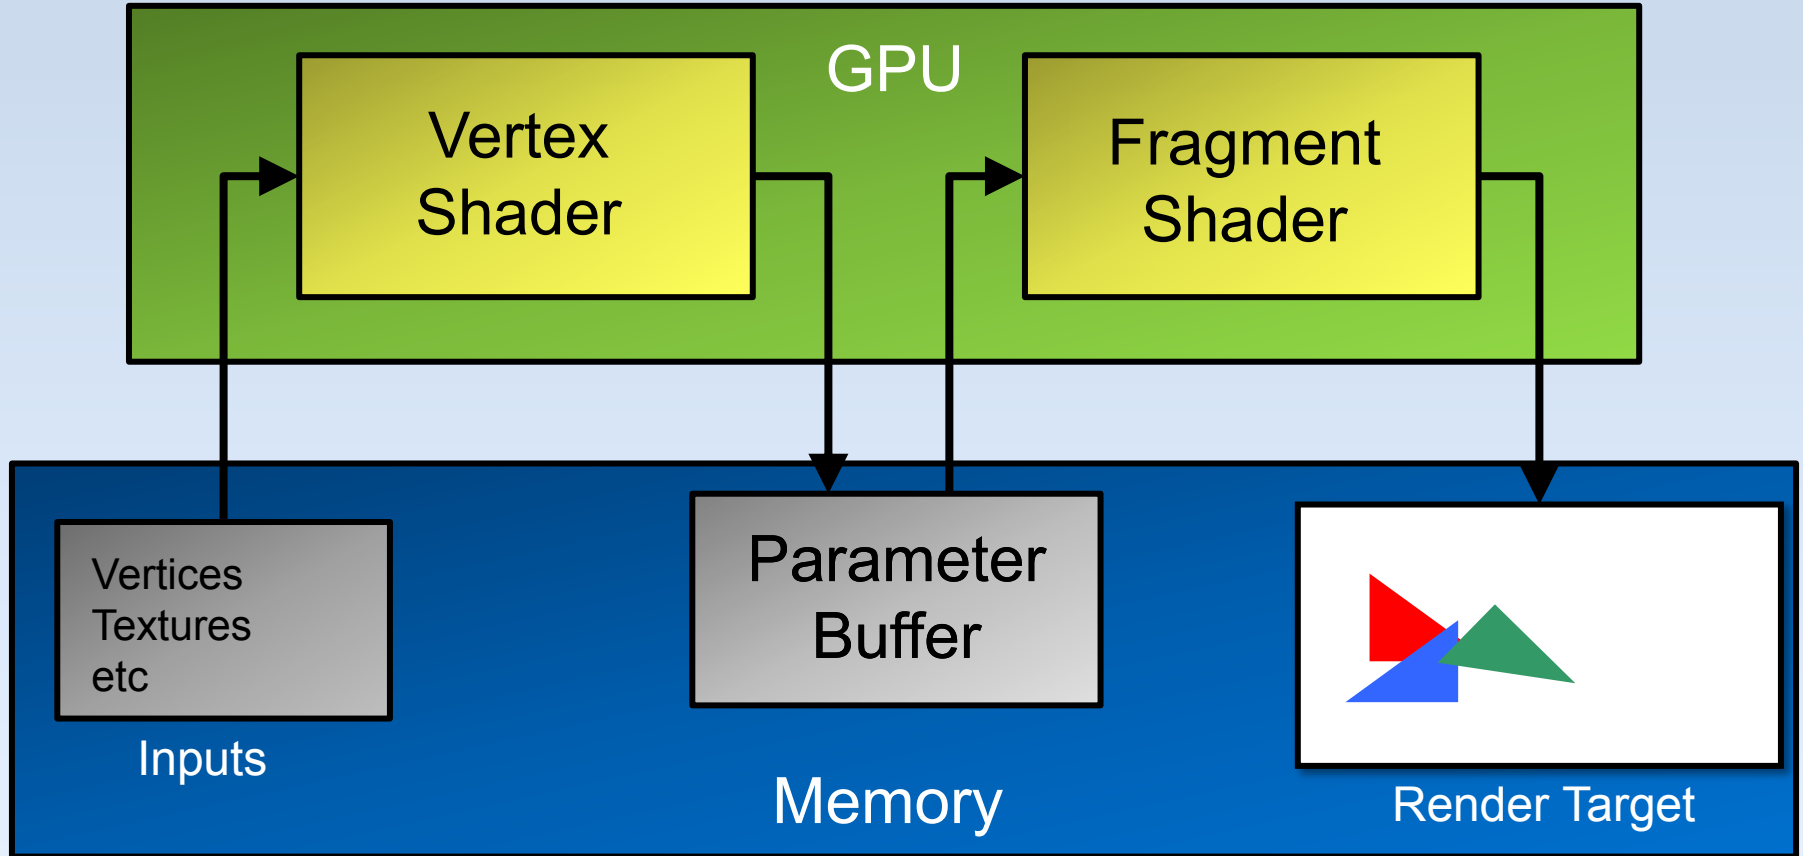

- Multiple threads in parallel on each core
  - Switch to another thread while stalled
  - Zero cycle overhead
  - Vertex and fragment threads at the same time
- Textures can be fetched ahead of time
  - Before the shader runs

# Immediate Mode Renderer

# Tile Based Deferred Renderer

# Tile-Based Deferred Rendering

- Screen is split into tiles
- Each tile references relevant primitives in the parameter buffer

Screen

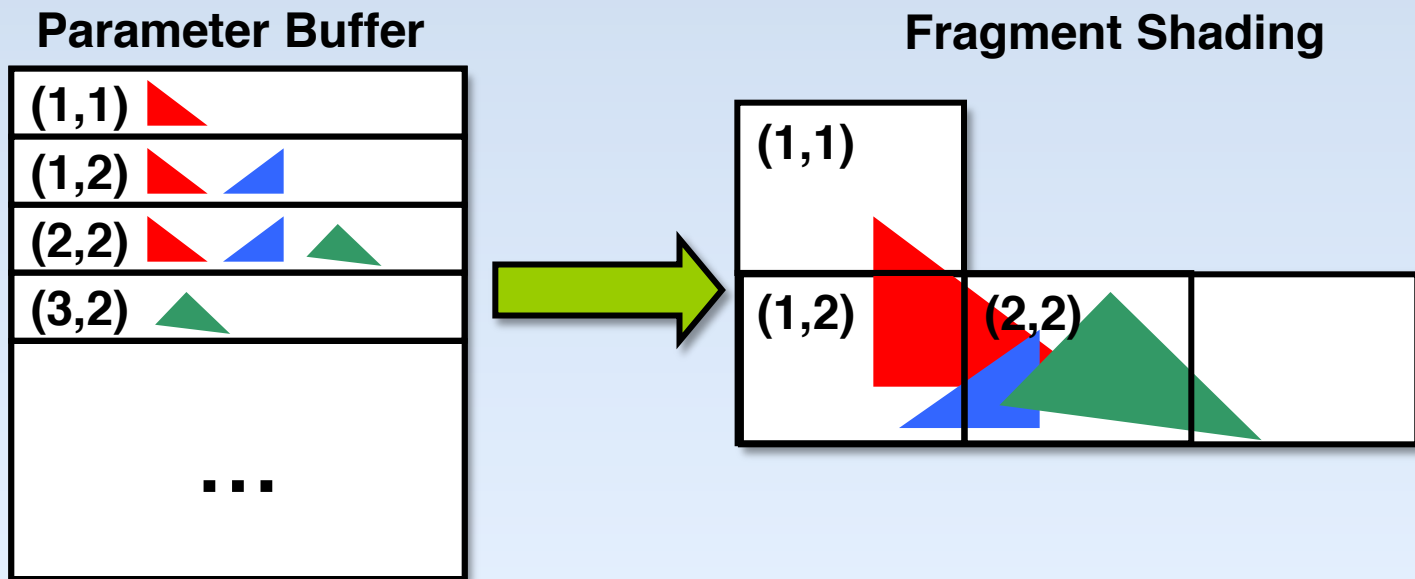

Parameter Buffer

# Tile-Based Deferred Rendering

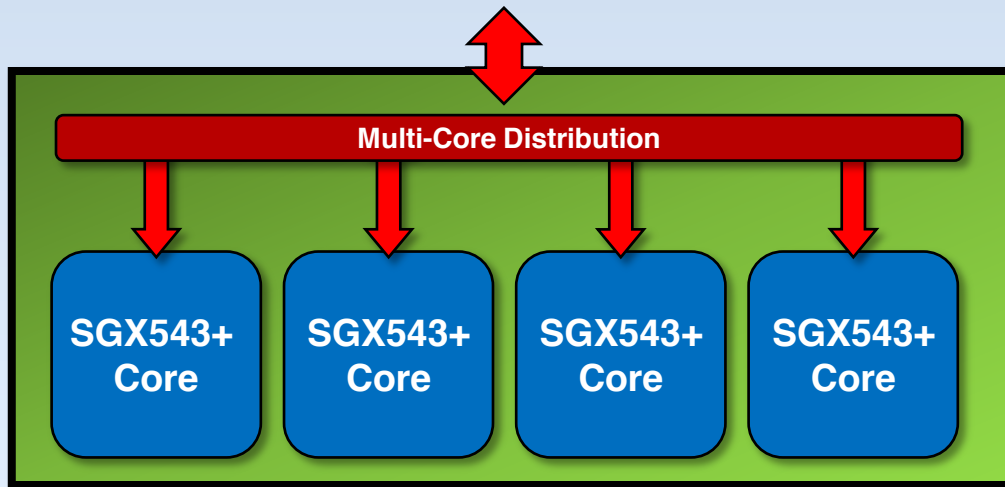

- Fragments in each tile processed for shading

# Tile Distribution

## Parameter Buffer

(1,1)	
(1,2)	
(2,2)	
(3,2)	
...	

# Opaque Geometry

- Only visible fragments in a tile get shaded

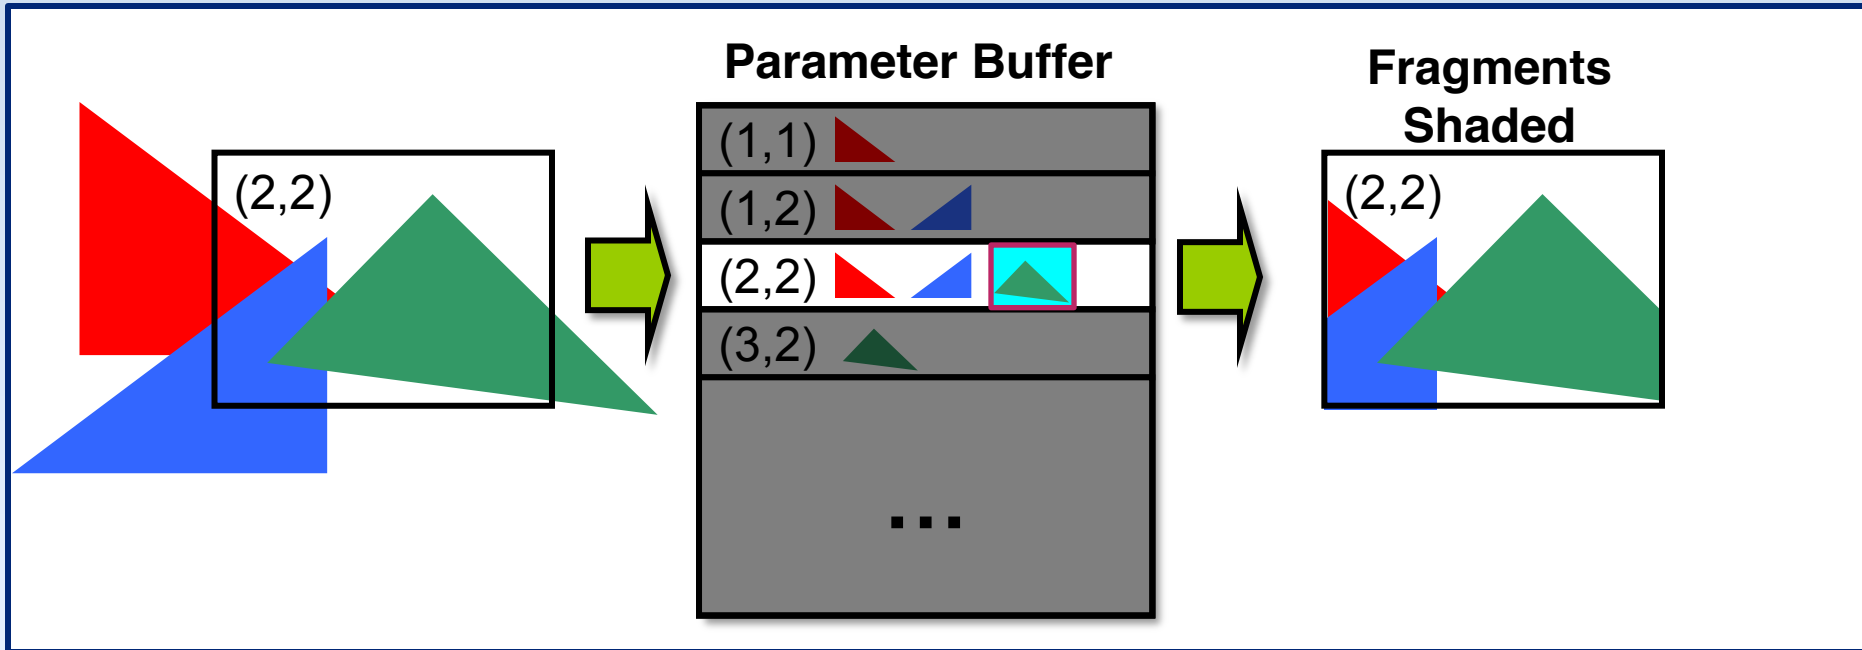

# Opaque Geometry

- Only visible fragments in a tile get shaded

# Opaque Geometry

- Only visible fragments in a tile get shaded

# Scenes

- Pipelined
- Vertex then fragment
  - within scene
- Vertex and fragment
  - Different scenes

```
BeginScene (...);  
Draw (...);  
...  
Draw (...);  
EndScene (...);
```

```
BeginScene (...);  
Draw (...);  
...  
Draw (...);  
EndScene (...);
```

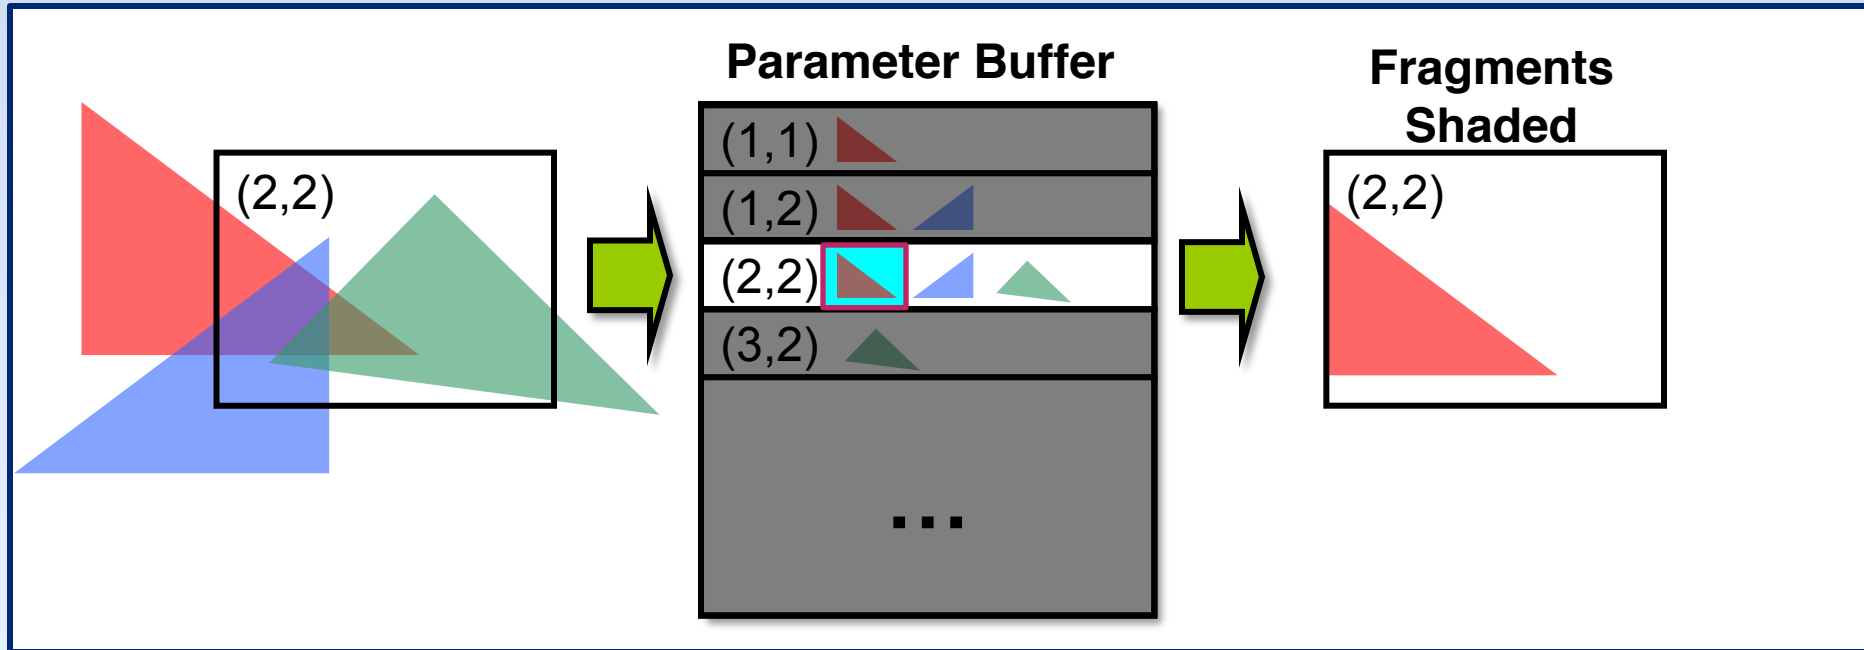

# Submission Process

- GPU consumes work in relatively large jobs

# Translucent Geometry

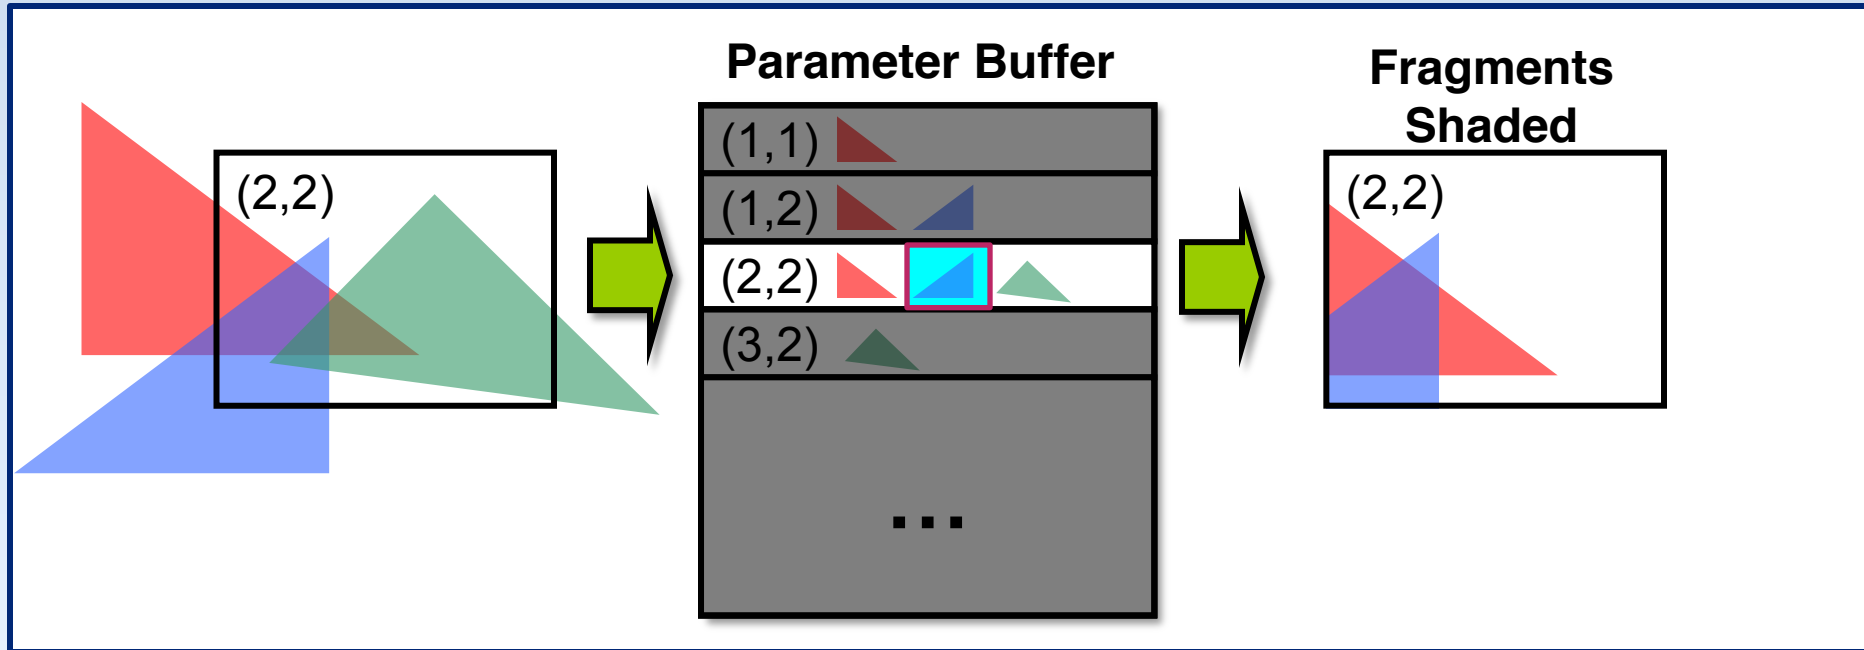

- Each blended fragment gets shaded multiple times
- Processing occurs in submission order

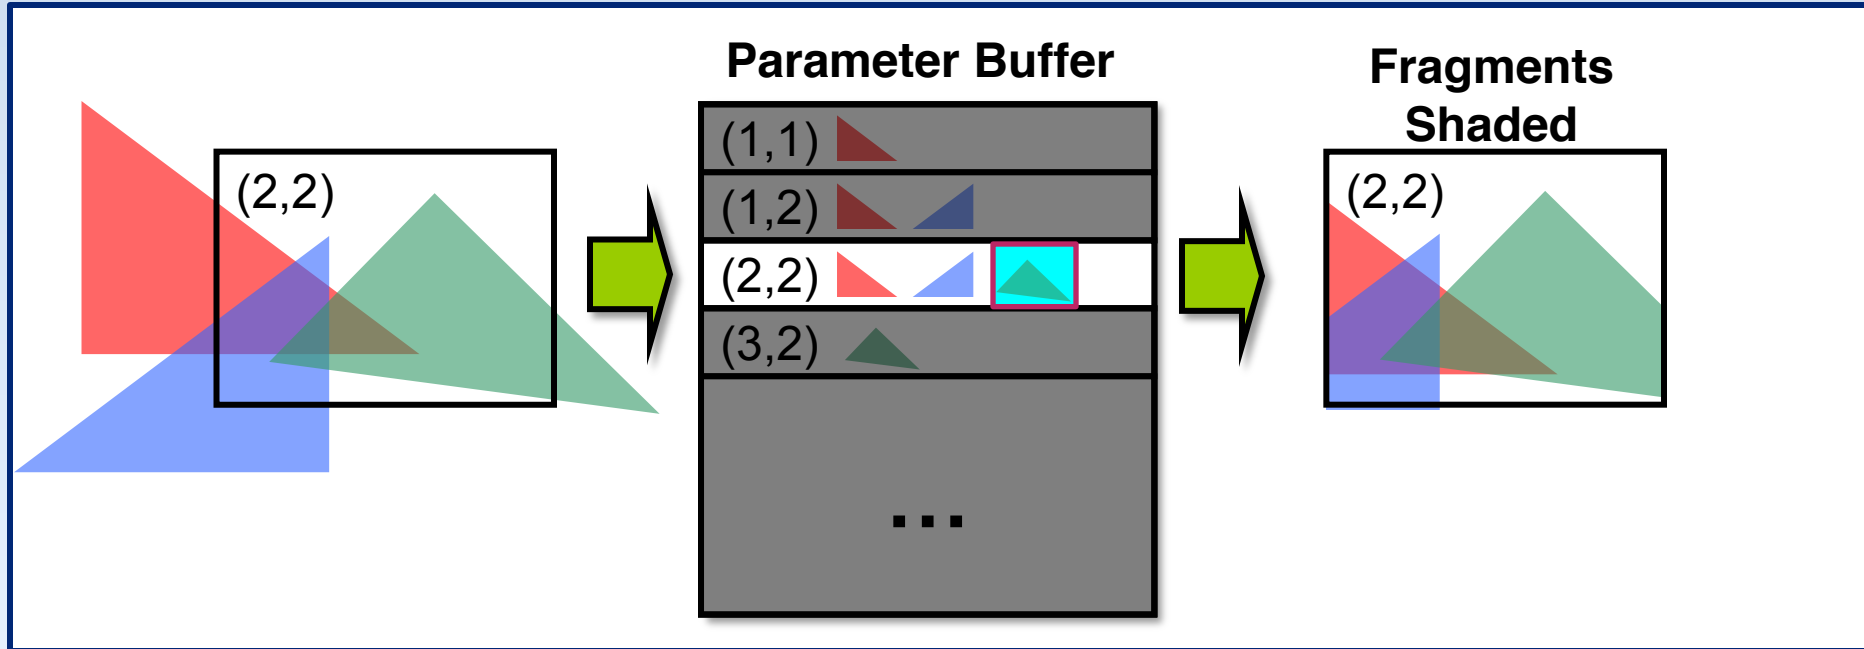

# Translucent Geometry

- Each blended fragment gets shaded multiple times
- Processing occurs in submission order

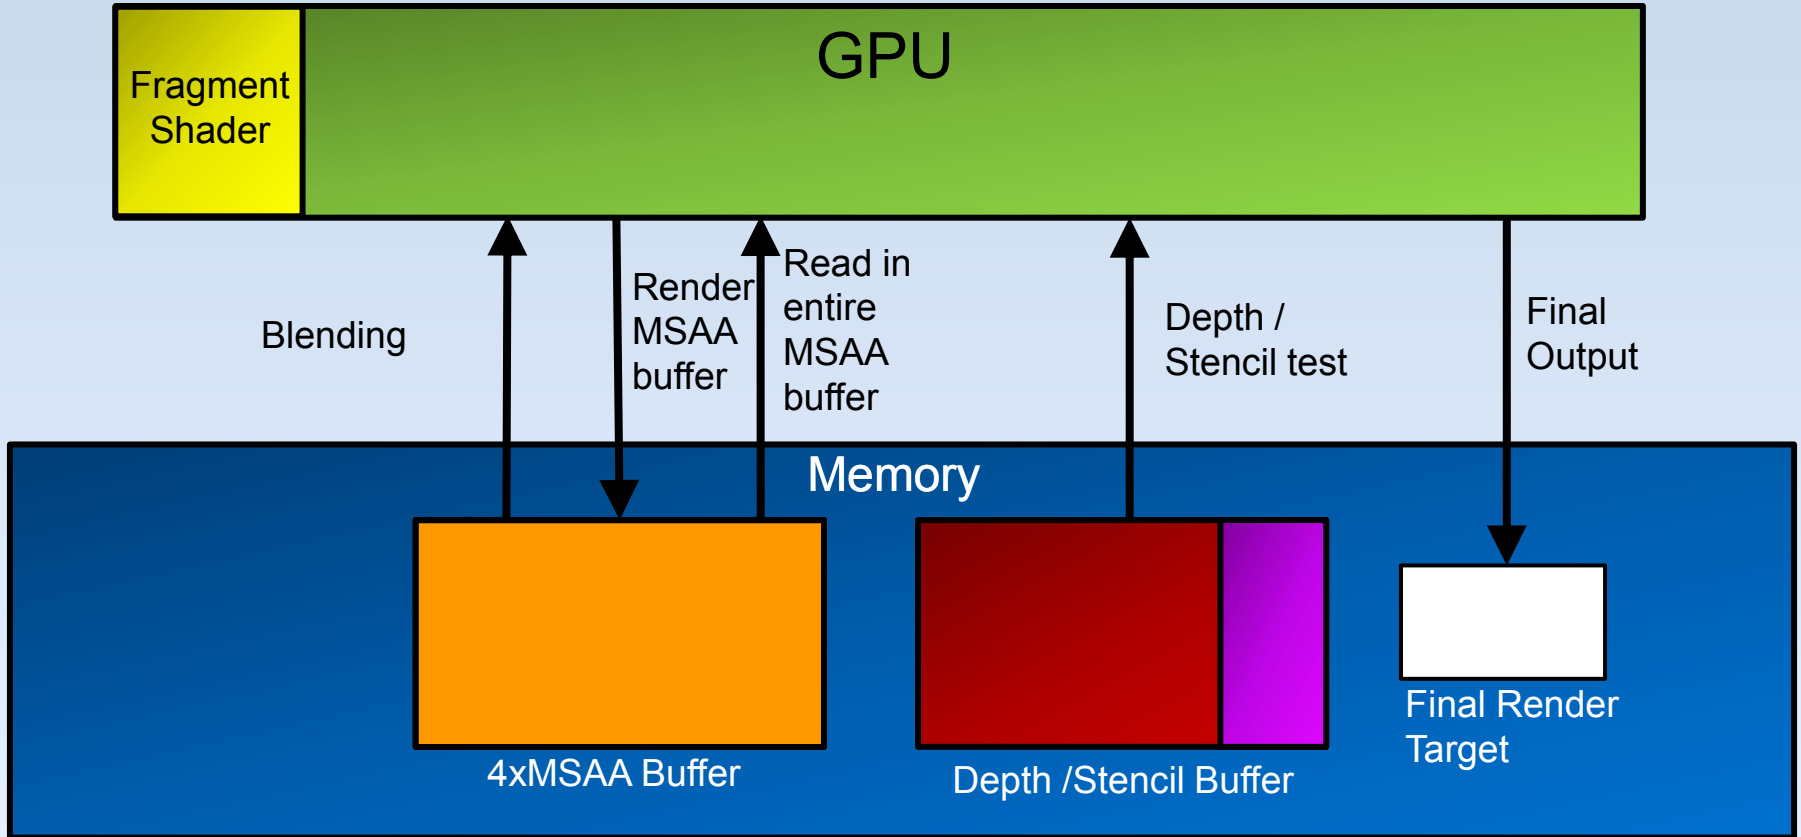

# Translucent Geometry

- Each blended fragment gets shaded multiple times
- Processing occurs in submission order

# Immediate Mode Renderer

# Tile Based Deferred Renderer

Depth / Stencil Tile

Colour Tile

Final Output

Memory

Final Render Target

# Programming Model

- No unnecessary complications
- Tile-based processing handled behind the scenes
- Leaving you a familiar API interface

PSVITA  
PlayStation Vita

SCEE  
Research &  
Development

# Shader Model 3.x+

- Familiar format of
  - Vertex / Fragment Shaders
  - Geometry
  - Textures
  - Render Targets
- Reduce asset size, but keep same visual fidelity
- Can be up and running in a few weeks

# Razor

- Next Gen version of SN Tuner and GPAD rolled into one
- Analyse CPU and GPU at the same time
  - Host PC
  - Target on screen HUD
- Fully integrated into Visual Studio
- Easy to track down you bottlenecks
  - Comprehensive CPU and GPU counters
  - Covers all cores
  - Intuitive Interface
- Lots of really cool features I'm not allowed to talk about

# Summary

- Created from the ground up for developers
- Rich set of interfaces
- Hardware does the hard work
- Shader Model 3.x+
- Powerful and intuitive tools
- Developer Friendly

# Thanks To

- SCEI
- SCEE R&D
- SCE ATG
- SN Systems
- WWS 1<sup>st</sup> and 2<sup>nd</sup> party developers
